

# Thunderbird calendar sync not working anymore since version 78

Affected version(s): all

## Symptom

Since the installation of Thunderbird 78 or later the sync of the calendar isn't working anymore.

## Root Cause

Because of the merge of the calendar plugin lightning into Thunderbird the user-agent changed from Lightning to Thunderbird. This matters only if you use the UserAgent method to recognize the traffic.

## Solution

Have a look at the updated documentation:

[https://documentation.open-xchange.com/latest/middleware/miscellaneous/caldav\\_carddav.html](https://documentation.open-xchange.com/latest/middleware/miscellaneous/caldav_carddav.html)

You can add the RewriteCond for Thunderbird or use one of the other possible methods.

**STATUS: documentation fixed**
